

Fee calculator

The fee calculator can be used for estimating approximate cost of regasification of a given LNG volume assuming the power of regasification in the amount indispensable for regasification of the assumed volume.

The received volume is reduced by the amount of LNG collected in kind by the LSO and used for the purposes of the regasification process (about 1.5%).

Please be informed that the data computed with the use of the above-mentioned calculator are of informative nature only and may not be treated as an offer as specified in Article 66 of the Civil Code.

The computed total fee for regasification is the net value. Please add the goods and services tax (VAT) in the amount resulting from the effective tax regulations.
